Narrative Report on Final Project Progress

DE GUZMAN, Asher Nathaniel E. DELA CRUZ, Rupert C. MACARAEG, Mark Cyrus P.	Date: 2026-03-06

Narrative Report:

Transitioning from the design phase to actual implementation, we took a major step forward this week by officially translating our Entity-Relationship Diagram (ERD) into our chosen Database Management System (DBMS) which is phpMyAdmin. We heavily applied the concepts from our lessons on field design to physically build the tables for Kody (K:GPLPCMS), ensuring every single data element was highly optimized and well-suited for our system's specific requirements. By the end of the activity, we successfully generated and captured screenshots of our complete relational model, making sure no entities were visually overlapping so that all pertinent information was perfectly clear for our submission.

Taking charge of the physical database construction, Mr. De Guzman led the translation of our ERD into the actual DBMS. He utilized the data dictionaries he previously drafted to select the most optimized fields for our tables, carefully assigning exact data types and lengths to minimize waste and maximize performance. After successfully generating the tables, Mr. De Guzman navigated to the database's designer tool, meticulously arranged the elements so that no relationships overlapped, and captured the required screenshots of our entire database structure.

To ensure the structural integrity of our newly created database, Mr. Macaraeg thoroughly reviewed the implementation. He verified that all primary keys, foreign keys, and referential constraints perfectly aligned with the logical architecture we established in our Software Design Descriptor. Mr. Macaraeg also double-checked the relational model visualizer alongside Mr. De Guzman to guarantee that the final screenshots accurately and cleanly displayed all our system's entities and their relationships without any visual clutter.

Handling the documentation and project tracking, Mr. Dela Cruz focused on compiling the results of our database implementation. He took the pristine relational model screenshots generated by the team and properly integrated them into our final submission, ensuring they were attached exactly as instructed. Finally, Mr. Dela Cruz authored this narrative report to officially document our progress, detailing exactly how we successfully transitioned our theoretical designs into a fully functional, optimized database structure.
